PMP-104: Seal Inspection

For fictional pump PMP-104, inspect the mechanical seal every 30 days. Record visible leakage and seal condition in the inspection record. This interval is not determined by the pump's 12 bar rated pressure.

The illustrative scheduled seal replacement interval is 1,000 operating hours. Visible damage requires a separate maintenance review; this sample does not authorize continued operation or prescribe a repair procedure.

PRS-204: Sensor Review

For the fictional pressure sensor PRS-204 on pump PMP-104, the calibration review interval is 90 days. Review an alarm alongside the measured pressure and maintenance history before assigning a cause.

The inspection record contains observations, not a fault diagnosis. Elevated vibration alone does not establish that the mechanical seal or pressure sensor caused it. This guide supplies no vibration limit or diagnostic procedure.
