PMP-104: Specification

The fictional pump PMP-104 has a rated pressure of 12 bar. Its normal operating pressure range is 6 to 10 bar. Rated pressure is a specification limit, not a recommended operating setpoint.

PMP-104 uses a mechanical seal to limit leakage around its rotating shaft. Seal inspection and replacement intervals are described in the separate maintenance guide.

This educational specification does not state the motor power, motor speed, or electrical supply. Those properties cannot be inferred from the pressure rating.

PMP-104: Pressure Monitoring

The pressure sensor PRS-204 monitors pump PMP-104. The illustrative high-pressure alarm threshold is 9 bar. An alarm is a reason to review the inspection record, not proof that the pump or sensor has failed.

A measured pressure within the normal operating range does not prove that all components are healthy. Pressure and seal condition are separate observations. Consult the maintenance guide for inspection intervals.
